WEEK 3

1. Analyse 8 Puzzle problem and implement the same using Breadth First Search Algorithm.

```
Program:
def bfs(src,target):
  queue = []
  queue.append(src)
  exp = []
  while len(queue) > 0:
    source = queue.pop(0)
    exp.append(source)
    print(source)
    if source==target:
      print("success")
      return
    poss_moves_to_do = []
    poss_moves_to_do = possible_moves(source,exp)
    for move in poss moves to do:
```

```
if move not in exp and move not in queue:
         queue.append(move)
def possible moves(state, visited states):
  #index of empty spot
  b = state.index(0)
  #directions array
  d = []
  #Add all the possible directions
  if b not in [0,1,2]:
    d.append('u')
  if b not in [6,7,8]:
    d.append('d')
  if b not in [0,3,6]:
    d.append('l')
  if b not in [2,5,8]:
    d.append('r')
  # If direction is possible then add state to move
  pos_moves_it_can = []
```

for all possible directions find the state if that move is played ### Jump to gen function to generate all possible moves in the given directions

```
for i in d:
    pos moves it can.append(gen(state,i,b))
  return [move it can for move it can in pos moves it can if
move_it_can not in visited_states]
def gen(state, m, b):
  temp = state.copy()
  if m=='d':
    temp[b+3],temp[b] = temp[b],temp[b+3]
  if m=='u':
    temp[b-3],temp[b] = temp[b],temp[b-3]
  if m=='l':
    temp[b-1],temp[b] = temp[b],temp[b-1]
  if m=='r':
    temp[b+1],temp[b] = temp[b],temp[b+1]
```

return new state with tested move to later check if "src ==
target"

return temp

$$\# src = [1,2,3,4,5,6,0,7,8]$$

$$src = [1,2,3,0,4,5,6,7,8]$$

bfs(src, target)

Output:
